

repoVisualizer

What is this?

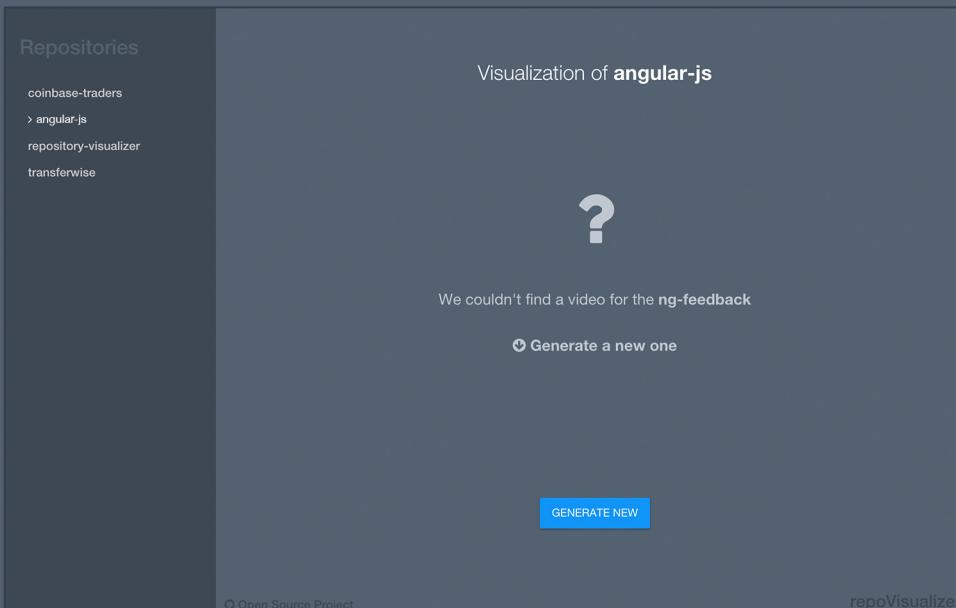

repoVisualizer is a host yourself web application that in the background uses *Gource* to generate video visualisations of *Git* and *Mercurial* repositories. Create, recreate and access them from one place with press of a button.

Why should I use it?

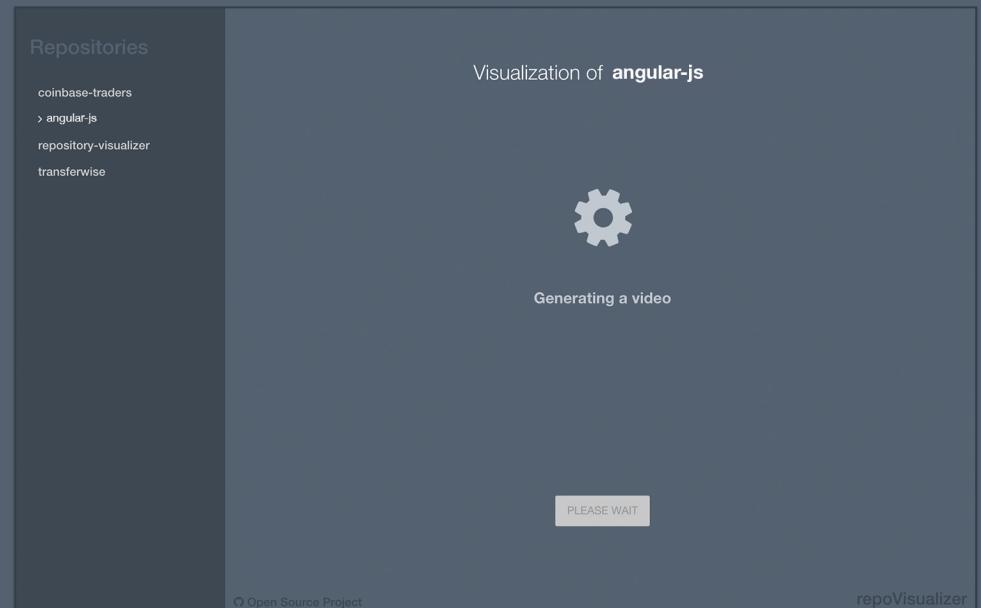

repoVisualizer allows you, your whole team, management and even your not so tech savvy clients to see in an understandable and visually appealing way that even though nothing has changed from outside, work is in progress. Host competitions between teams and see when are developers working most intensely

What's next?

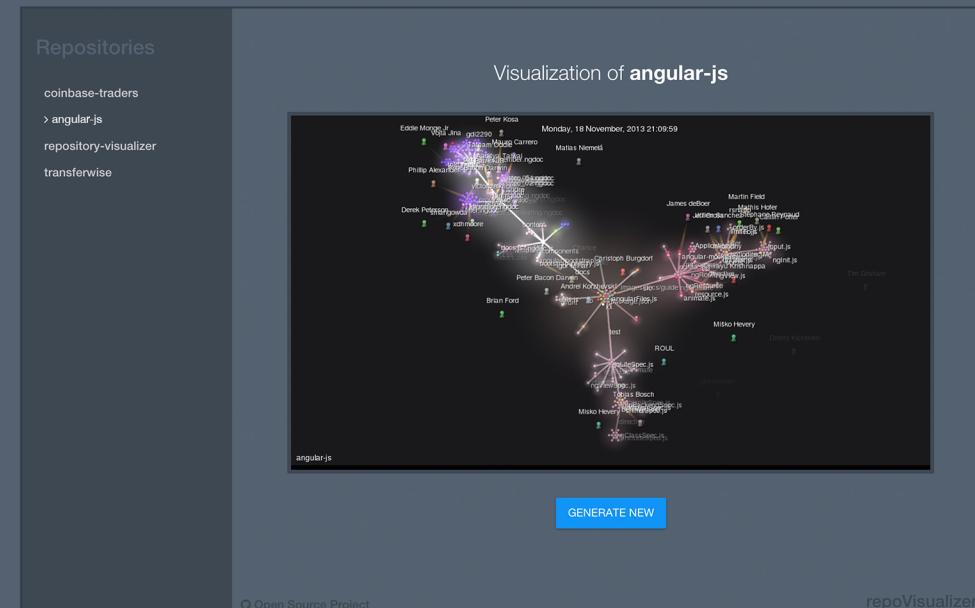

repoVisualizer has been built as an *MVP*. We work hard to deliver our main features in a best possible way and promise not to lose focus. In next release we plan to add compound video of multiple repositories, scheduled video generation, date interval and a lot's of internal improvements.
